EXPERIENCE

Senior Software Engineer, Full-Stack

City Furniture (via True North Infotek), Bengaluru | June 2026 – Present

- Built an embedded fulfillment module inside the enterprise CRM (Node.js, React) so operations staff could book third-party deliveries without leaving the order workflow.
- Own the integration layer against external carrier APIs: webhook listeners, bidirectional sync, and schema validation that keeps tracking metadata consistent across systems.
- Duplicate bookings were a recurring failure. Added idempotency keys and retries with exponential backoff, plus reconciliation logic that recovers state when a carrier API goes down mid-request.
- Shipped live driver-to-job assignment in DispatchTracker, replacing manual dispatch coordination.

Software Engineer

Perfect Solutions, Miami, Florida | September 2025 – March 2026

- Designed Java and Spring Boot microservices that improved API throughput by 22% and reduced request latency.
- Built React features against secure REST APIs; moving validation server-side cut client-side validation errors by 28%.
- Wrote the JUnit and Mockito suites for the services I owned, and automated the CI/CD pipeline to cut deployment time by 20%.

Generative AI Engineer (Intern)

Lid Vizion LLC, Miami, Florida | August 2024 – April 2025

- Built a text-to-3D generation pipeline on the Meshy AI API, with rendered assets in S3 and metadata indexed in MongoDB.
- Swapped direct downloads for pre-signed S3 URLs, which cut retrieval latency and let the service absorb roughly 25% more traffic.
- Built an assessment engine on the OpenAI API that generates quizzes from uploaded documents, turning hours of manual content work into minutes.

Software Engineer I

Evive Health, Bengaluru | January 2021 – September 2022

- Broke a monolithic healthcare benefits platform into Java and Spring Boot microservices, isolating failures that had previously taken the whole system down.
- Profiled and tuned the core REST APIs, bringing response times from 800ms to 600ms. Won the internal 'Team MVP' award for it.
- Built a serverless backend on AWS Lambda, S3, and DynamoDB that reduced infrastructure spend by about 20%, and containerized the release pipeline with Docker, halving deploy time.

SELECTED PROJECTS

Real-Time Vehicle Telemetry Platform — FastAPI, Next.js, GCP, Vertex AI, Pub/Sub

- Event-driven pipeline ingesting high-frequency sensor data through Cloud Pub/Sub, feeding live telemetry into Gemini for in-context strategic predictions and pushing updates to the browser over WebSockets at sub-200ms latency.

Financial Market Intelligence Platform — FastAPI, React, Model Context Protocol

- Agentic RAG system where the model orchestrates its own tools (market data APIs, news scrapers) over MCP; vector embeddings and sentiment analysis turn unstructured news into quantitative signals, with daily briefings generated in under three seconds.

FocusTube — Chrome extension, shipped and sold | focustube.tech

- Paid Chrome Web Store extension that strips YouTube to a search-only interface. Runs fully client-side with no server or data collection. Built, launched, and marketed solo.

EDUCATION

M.S. Computer Science, Florida International University | [DATES] | GPA 3.9/4.0

B.E. Computer Science, Siddaganga Institute of Technology | [DATES] | GPA 3.4/4.0

TECHNICAL SKILLS

Languages: Java, Python, TypeScript, JavaScript, SQL

Backend: Spring Boot, FastAPI, Node.js, REST APIs, microservices, event-driven systems

Frontend: React, Next.js, Redux, Tailwind CSS

AI/ML: RAG, LangChain, Model Context Protocol, OpenAI API, Vertex AI, vector databases

Infrastructure: GCP (Cloud Run, Pub/Sub, Vertex AI), AWS (Lambda, S3, DynamoDB), Docker, Kubernetes, CI/CD

Data: PostgreSQL, MongoDB, DynamoDB, Supabase, Redis
